

UNIVERSAL SHOPPING CENTER FOR INTERNATIONAL OPERATION

Technical Field

5 The present invention is related to electronic merchandise catalogue and ordering systems for use on the internet/intranet. In particular, the present invention is directed to the facilitation of international purchasing of goods over the internet/intranet, addressing all aspects of such transactions.

Background Art

10 Consumers have already discovered the advantages of shopping from their homes by the use of catalogues, television shopping channels or by computer transaction systems. There are numerous public internet web sites and private intranet sites that offer various articles and services for sale. Most of these public web sites and
15 private sites operate in national configurations where the buyer and seller are restricted to a particular language and currency.

There are a number of transaction systems using electronic communications, including the internet, as conduits for carrying out an exchange of goods and funds. The conventional technology includes a number of examples containing

some relevant elements for international transactions for goods to be sold across national boundries.

U.S. Patent No. 5,319,542 to King, Jr. et al., teaches a system for ordering items using an electronic catalog stored on a publicly accessible database. The patent includes a description of a related scheme of online catalogs provided by the Prodigy Corp., as set out in col. 1, beginning with line 26. The use of the Prodigy system suggests the use of the internet for providing both catalog information and as a conduit for entering electronic purchase orders to be sent to the vendors. A key aspect of the catalog system is that both public and private catalogs can be maintained. Both can be updated electronically, presumably through the internet since other methods are not described. The catalog system includes provisions for pre-negotiated prices and predetermined shopping lists for specific customers. A key marketing aspect of this system is the provision of competing product information since catalog data from multiple vendors is provided for the public electronic catalog. The authorization aspects of the requisition process appear to be limited to that carried out within a customer's own organization rather than through a third party bank or clearing house.

U.S. Patent No. 5,420,405 to Chasek discloses a system of creating electronic or virtual money for personal transactions. The virtual money can integrate the functions of cash, checks and credit cards while the system provides constant surveillance against fraud. This virtual money is conceived as an international medium of exchange, and includes provisions for automated sales tax collections and payments. As a result, the purchase price is incremented by multipliers for city, state and federal tax within national borders. The system uses an on-person terminal permitting automated transactions of all sorts as well as record-keeping of personal accounts. This terminal system includes a known universal toll-paying system using point-of-sale debiting via radio signals. The Chasek system uses an electronic banking sub-system that can transfer funds between two individuals. The operation of the system includes the use of medium-exchange packets of bytes that identify the personal account custodian, the payer, the amount of transaction, the type of transaction, the vendor, a security number and a national code. Such a transfer uses a personal account custodian to transfer between the customer (who has transferred funds into a predetermined account) to another individual such as a vendor who then obtains access to those funds via the personal account custodian. Communications between personal account custodians and vendor account custodians are carried out using radio waves via a

satellite transponder, insuring that a personal account custodian in one country can reach a vendor account custodian in another country.

U.S. Patent No. 5,594,225 to Botvin discloses a method for conducting financial transactions via digital facsimile wherein the transaction is cleared after the draft documents faxed by the payer to the payer's bank are presented and processed via machine-readable equipment.

U.S. Patent No. 5,666,493 to Wojcik et al. discloses a system for managing customer orders including an electronic catalog to streamline the buying functions. The system has an order management function, integrated with financial services to process orders and create financial records. The system also includes a logistics function for consolidating orders for optimum delivery over existing transportation systems. An inventory management system is also included and arranged to cooperate with the order management function. This functionality is achieved by accessing each subsystem data base on a real-time basis by horizontal integration of each subsystem to create an efficient data flow between the various subsystems. The selection of the details of transporting the goods is one of the subsystems that is accessed on a real time basis. Thus, customers entering orders

can be provided with the shipping costs as well as other shipping details as the order is input. Likewise, credit authorization can be carried out on a real time basis as an order is entered.

5 U.S. Patent No. 4,926,368 to Morita et al. discloses an electronic currency conversion apparatus. Likewise, U.S. Patent No. 4,766,293 to Bosten discloses a transaction card capable of authorizing a transaction using various currencies.

U.S. Patent No. 5,644,721 to Chung et al. discloses a computer reservation system using a "global currency" to carry out consolidation of travel reservations

10 throughout the world. U.S. Patent No. 5,644,115 to Fraser discloses a system for automatically matching sellers and buyers using, among other techniques, the internet. U.S. Patent No. 5,351,189 to Doi et al. and U.S. Patent No. 4,383,306 to Morimoto et al. both disclose electronic language translators.

15 If there are international sales, realistic currency conversions become a factor, as do issues of customs, import/export duties and shipping. These are not taken into account in conventional transaction system. Also, in conventional internet or intranet transaction systems the translations of all foreign catalogues, including the full terms of sale and shipping costs, are not always provided. As a result the
20 buyer of goods from a foreign country often faces large, unexpected charges upon

delivery of the goods. Such systems are clearly not suitable for a global market place or the requirements of doing business internationally.

Summary of the Invention

5 Therefore, it is one object of the present invention to consolidate all the disparate components of an international sale into one program whereby a buyer can go shopping by computer almost anywhere in the world.

10 It is another object of the present invention to provide a transaction system whereby a buyer can go shopping by computer almost anywhere in the world using the buyer's own language.

15 It is a further object of the present invention to provide a transaction system whereby a buyer can go shopping by computer almost anywhere in the world and see a display of goods priced in the buyers own currency.

20 It is yet another object of the present invention to provide a transaction system whereby a buyer can go shopping by computer almost anywhere in the world and be provided with full shipping charges for the delivery of selected goods so that the shipping costs are paid as part of the overall price of the goods selected.

It is still an additional object of the present invention to provide a transaction program whereby a buyer can go shopping by computer almost anywhere in the world so that goods selected for purchase are priced to include any import duties or other such taxes accruing to the purchaser thereby allowing the purchaser to
5 pay these funds as part of the cost of the goods selected at the time of the purchase.

It is yet a further object of the present invention to provide a transaction system whereby a purchaser can go shopping by computer almost anywhere in the world
10 and purchase goods using an approved credit cards conventional system, or other electronic currencies.

It is still another object of the present invention to provide a transaction system whereby a buyer can go shopping by computer almost anywhere in the world so
15 that the buyer is able to compare products from different countries on a global scale.

Yet another object of the present invention is to provide a transaction system
20 whereby a buyer can go shopping by computer almost anywhere in the world to

facilitate direct consumer sales or business to business sales.

Yet an additional object of the present invention is to provide a forum whereby manufacturers can expand into new export markets by way of a transaction system that allows a buyer to shop by computer virtually anywhere in the world, thereby lowering distribution costs to the manufacturers and as a result, consumer costs.

These and other objects of the present invention are achieved by a system for carrying out an international transaction over EMF conventional links carried out over the internet using computer to computer communications. The process is initiated by accessing an internet web site or private site controlled by the international transaction program. The customer accessing the web site then selects a language in which to view catalogue information. The customer also selects the currency in which to pay for the products to be bought. After selecting products for consideration the customer can trigger calculation of all charges involved in an international transaction for purchasing the selected product by selecting of a shipping destination. If the customer chooses, he can initiate the order for the selected product including automatic credit authorization, and the generation of an electronic title.

Brief Description of the Drawings

Figure 1(a) and 1(b) constitute

Fig. 1 is a flow chart depicting the operation of the transaction system of the present invention.

Detailed Description of the Preferred Embodiments

The design of the international shopping and transaction system of the present invention creates a seamless order entry system for shopping on the World Wide Web or private networks. A plurality of computer databases and systems are accessed to complete the functions necessary for both national and international transactions for the purchase of goods and services. All of the interactions between the various external databases and the transaction program are controlled by transaction program. The transaction system contains or interacts with various databases, including :

- 1) product and catalogue information, including translations to different languages of product catalogues;
- 2) currency information, including conversion data and alarm data indicating instability;
- 3) product codes from harmonized tariff tables, including tax and import information, including administrative requirements and data for satisfying

such requirement as well as foreign duty information, including methods of calculating all duties, luxury taxes, etc.;

4) vendor inventory and order entry database;

5) shipping information, including all options for each leg of a journey between product origination and customer destination.

6) credit authorization and/or funds transfer confirmation database and processing system; and,

7) customer information, including credit and financial data, as well as purchasing records and profiles.

These databases interact in the manner shown in the flowchart of Fig. 1 and as described below to provide all of the necessary information to complete a transaction. Communications between the transaction program, the customer and the various databases can be carried out using any of electromagnetic force (EMF) wave communications link such as radio waves, light pulses, telephone lines, etc.

The system integrates all of the aforementioned databases, (depicted as databases 1-7 in Fig. 1), including databases owned by the system operator controlling the transaction system of the present invention, as well as external databases (such as credit authorization database 6).

The initial entry into the system provides an opportunity to determine the speaking language of the customer. The selection of language operates a default to select the most likely currency of the customer unless the customer indicates otherwise.

The system is set up so any or all countries of customers can be linked to any language and prices converted to any currency. However, in practical terms some products will not be available in all countries nor appropriate for all countries.

Once the language has been determined and the currency has been selected, the customer is then able to review product listings that have prices that reflect the currency and taxes of the country in which the customer resides.

The precise operation of the inventive international transaction system is depicted in the flow diagram of Fig. 1, which is suitable for national as well as international transactions. At step 101, a user accesses the internet web site upon which the customer portion of the transaction is carried out. A menu is provided to the user or customer permitting selection from among a plurality of different catalogues in a manner already well known in the conventional art. However, the present transaction system differs from conventional systems in that the user is able to select a preferred language at step 102.

A plurality of catalogues, each translated into a plurality of different languages are

available on the system. A particular catalogue or set of catalogues, in a preferred language, are accessed ^{step 104 from} and processing center ^{designated as} ~~(step 104) from~~ the first database and

downloaded for access by the user. Preferably, the language translation databases

^(not shown) containing the translations of all of the catalogue material are held in separate

5 databases on computers separate from those handling the interface with the customers. This arrangement will save time and memory space for the computers actually handling the transaction. The first database can be managed by the system operator of the inventive transaction system or can be external to the transaction system. In the latter case, the system operator can access such data over the
10 internet, intranet or any other electromagnetic force (EMF) wave communications link.

Preferably, the user is provided with a plurality of different catalogues from among which to select on a real time basis. It is expected that many of the
15 catalogues will be from sources outside of the United States, as well as the English-speaking world. Consequently, there must be pre-translated versions of catalogues in non-English languages, thereby allowing real time access of each of the catalogues in a plurality of different languages.

This is handled by the first data base and processing center (depicted as 1st database in Fig. 1) which serves as a catalogue builder. At step ¹⁰⁶ ~~105~~ a desired catalogue (and its country of origin) is selected and the country of the customer is input to select a default currency, which is used as a trigger to guide the operation or portions of the transaction process once a product or products are selected from the electronic catalogues. The downloading of the country of origin of the selected catalogue ^(step 106) also triggers an automatic access ^(step 191) of the translation database (2nd database and processing center in Fig. 1) to provide the specific currency conversion between that of the original catalogue country and that of the customer as selected by the automatic defaults. However, the customer has additional currency conversion options as described with respect to ^{step} ~~the~~ 112 supra.

Since a plurality of catalogues are contemplated, a "power search" for a specific product (or service) from among all of the catalogues is available to the customer in order to decrease the search time for the desired products. If an optional "power search" is requested at step 107, automatic access of the language translation database occurs to search the selected language versions of each of the catalogues contained therein. Once this has been done, a list of catalogues is provided to the customer in menu form so that the customer may view any or all of the catalogues.

At step 108 the customer selects and views a particular catalogue and product within that catalogue for consideration. The product is presented in menu form so that the variations and permutations, and other characteristics of the product can be studied. This is done in menu form in a manner well known in the conventional art directed to electronic catalogues. In the alternative, a catalogue from a particular vendor can be selected instead of going through the "power search" of the entire catalogue inventory. Further, the "power search" engine can be activated once more ^(step 107) to find a particular product in the selected catalogue. In the alternative, a printed index (such as those used in hard copy catalogues) can be provided.

Making a selection ^(step 110) from the catalogue produces linked web pages for any of the products listed. The power search function from the product page allows the customer to search for key words for one or all of the catalogues listed. In each catalogue a manufacturer's index allows to look at products from a single manufacturer. The customer can also go backward or forwards through the program at any time. A picture (or several pictures) of the product are normally accompanied by a description of the product, name of the manufacturer, shipping weight, cost (in the customer's currency), and other information about ordering options (available sizes, colors, styles, etc.) and the means to select multiple units

of the product (with the desired options).

When a particular product is selected ^(step 110) ~~in the customer's currency~~, a price in the customer's currency is automatically requested. Normally currency is chosen by default ^(based upon the selection of step 102) ~~(step 105)~~. However, the customer has the option of selecting a particular currency (step 112) in which he wants the catalogue price of the selected products.

The currency conversion ^(step 191) is carried out at the second database and processing center. This second database provides a "real time" conversion from the currency of the country in which the catalogue originates to that selected by the customer.

The price is provided to the customer with a clear indication that this is the price for delivery at the ^{vendors} ~~vendors~~ factory or at one of the vendor's distributors, not the customer's location.

However, there are difficulties with "real time" currency conversion. For example, because the currency trading is carried out electronically, there may be an almost constant change in the conversion rate. Consequently, it is necessary to freeze the conversion rate for purposes of carrying out a selected transaction at a particular point in time. This can be done automatically (step 116) at the time that the customer initially asks for the converted catalogue price by selecting a particular product. In order to compensate for any disparity between the quoted

exchange rate and the real exchange rate when the transaction between the customer and vendor takes place (either independently or through the auspices of the present transaction system), the transaction system adds a small percentage to the conversion rate (step 117). This percentage can also accommodate any charges to the vendor or customer for using the transaction system and taking advantages of the conveniences inherent thereto.

At step 118, an automatic alarm is activated when one or both of the currencies in the selected conversion process are exhibiting wide fluctuations in value. Such fluctuations can be determined by the system operator so that when in the operator's opinion, currencies become unstable, transactions in one or both of the subject currencies can be suspended by the system. Such suspension can be automatic or manual, depending upon the preferences of the system operator.

When the decision is made, a message is sent to the customer instead of a price, indicating that because of instability in the currency market, transactions in a particular currency have been suspended. At which time, the customer^(step 190) can be offered the option of an alternative currency, if such an alternative is feasible. For another option, the customer can be offered a higher price to compensate for wide swings in currency conversion values. Any or all of these opinions are presented to the customer, along with any other desired catalogue information, at step¹⁹⁰ 119.

(step 190)

Should the currency conversion be stable, the price is displayed¹⁹⁰ to the customer almost instantaneously after either step¹⁹⁰ 105 or optional step 112. Also displayed with the price is a message indicating that the price displayed is limited to the vendor's factory, or one of his outlets, however the vendor may choose. The message will also indicate that the customer must request additional information to obtain the price for the product to be delivered to a destination of the customers choosing. It is crucial that the message clearly indicate to the customer that there is far more expense involved to obtaining the goods than merely the original price at the factory or the distributor of the vendor. This is especially true if the vendor and customer are in different countries, such as the United States and the Netherlands ^{Table A below illustrates this situation} ~~(see Appendix I)~~.

Thus, the customer is given the option of determining the real price of the transaction. If the customer makes this request (step 120), the next stage of the inventive process is carried out. Responsive to an affirmative answer by the customer, a commodity code for the selected product is obtained (step 122) by accessing the third database and processing center, containing look-up tables of the harmonized international tariff tables and classification system, as well as the formats for any necessary import/export data, and administrative requirements for all countries involved in possible transactions. If the vendor's country of origin or

the destination country have commodity codes different from those of the
harmonized tables, a search is conducted in other databases by the third database
and processing center to determine the correct commodity code. This ^{search(not depicted)} will be used
to look up other data related to the product and the country of destination, as well
5 as generate appropriate documents from the third database. The commodity code
can be displayed to the customer for his or her information. However, this is not
necessary. Rather, the commodity code in conjunction with the country of
destination is used to trigger certain subsequent operations of the inventive
transaction process as depicted in Fig 1. ^{at steps 130 and 132 supra}

10 The "real price" or the price to deliver selected products to a specified point
(presumably one convenient to the customer) entails the cost of all freight for each
leg of the journey, insurance (if desirable), sales taxes, handling charges,
document generation and forwarding charges, import/export duties, and "value
15 added" taxes as well as luxury taxes (if applicable). The first step in calculating
the cost of freight is to find out the total number of items to be shipped. This is
input by the customer at step 124. ^{At this} ~~at the~~ point a determination is made between
20 retail and wholesale transactions based on product type and amount, ^(from the catalogue data) and customer
identity. This determination can trigger the selection of shipping conditions at
step 128 ^{immediately} supra. This operation will ^{immediately} trigger an operation (step 125) of checking

with the vendor that the indicated number of the selected products is available.

6 This is done by accessing ^(step 192) a fourth database and processing center (preferably generated and maintained by the selected vendor), ^{This operation includes} automatically contacting the vendor and requesting confirmation of the inventory. Should the requested

5 number of products be unavailable, a message can be sent back to the transaction program to be displayed to the customer. Also, any additional information regarding product availability, such as expected delivery dates etc., can be provided at this time.

10 At step 126, the customer inputs the destination for purposes of calculating the cost of delivering the selected product or products to that destination. This information, in conjunction with the commodity code triggers the particular calculations for packaging, shipping, taxes, duties, insurance etc. of the rest of the transaction process. This is necessary to select the correct freight routes and

15 charge. If, for example, the destination point is within the vendor's country of origin (a determination made at step ¹⁹³ ~~126~~), the calculation of transport charges and duties is much simplified. Calculation of standard freight charges is provided, along with the optional insurance and any other charges, to the customer at step 127. This information can be displayed on the screen as soon as the customer
20 indicates the destination point due to the simplicity of the calculations.

in conjunction with
G The options that can be displayed ^{at} step 127 allow the customer to choose the various transport and insurance options that are available (depending on retail/wholesale status). Also, the vendor may offer a standard transportation package to customers that may be less expensive (because of vendor volume and leverage with carriers) than the options that would be available to individual customers. Where appropriate, customer selection of the options can be made at step 128 (if permitted by the vendor in a national transaction). A simplified operation of the inventive process would occur if a national transaction and no customer transport options were involved. As a result only sales tax would be added to the freight charges. Once the ^{selections} ~~decisions~~ at step 128 are made, the sales tax can be computed automatically and displayed to the customer at step 129. For most domestic transactions within the United States, the process would end at this point unless the customer chose to enter the order and begin that part of the process dealing with credit confirmation and the transfer of electronic title and the shipping of the selected goods.

G For international transactions (to which the present invention is ^{MORE} specifically directed) and situations in which a customer can select some freight options, the calculation of freight charges is ^{far} ~~for~~ more complex. First, (at step 130), revenue units are calculated for the products to be shipped in four different ways,

including: metric units for air transport; metric units for sea transport; standard English units for air transports; and, standard English units for sea transport. The precise calculations of each type of revenue unit ~~are found in Appendix H.~~ These calculations are standard in the shipping industry, and ^{are} based upon information derived from the third data base, ^(triggered at Step 122) including packing requirements ^{for} ~~based upon the~~ ~~characteristics of~~ the selected product or products. The type of revenue unit selected by a vendor, customer or the instant transaction program depends upon a variety of factors, including : the country of origin of the vendor; the country of origin of the shipper; the type of product involved (commodity code); and, (most important) the least expensive method of transporting the goods at issue.

At step 132 a determination of the discrete legs or links of the overall transport route are determined based upon shipping data contained in the fifth data base and processing center. This is also done based upon a standard shipping route dictated by the vendor, the route requested by the customer, or some combination of the two. The transport route is further based on type of product indicated or the commodity code provided by the third data base, which also provides the shipping and administrative requirements of a specific product. In many cases, the various discrete legs of the route are dictated by the nature of the product being shipped.

For example, an automobile being shipped from Germany to the United States will

be transported by sea, and embarked on ship at the port in Germany most convenient to the automobile manufacturer. The manufacturer will most likely dictate that the sea transport take place from the German port of his choice to New York city. At which point, the customer has options of how the car will be taken from the warf, through U. S. Customs, and to the final destination. Thus, between the vendor and the customer each discrete leg of the transport route is determined (step 132), as well as the costs accompanying each of those discrete legs of the journey (step 134).

10 An example of such expenses are found in ^{Table A} ~~Appendix I~~ ^{an example of} which depicts the costs for each discrete leg of the journey, and how such costs are added to the factory price of the goods of issue. Each discrete leg of route includes costs such as insurance, taxes, licensing fees, handling fees, and documentation fees. Thus, based upon the origin of the goods and the destination, as well as the revenue units for the package of the goods and the classification of the goods themselves, the cost of each discrete link is calculated ^{using factors} ~~in a manner~~ similar to the example found in ^{Table A} ~~Appendix I~~. ~~The calculations take place in a number of sub-steps as indicated in Appendix I.~~

20 Of course, the sub-steps are determined by the origin and destination. At step 134,

all costs such as freight, handling, basic taxes (such as sales tax) and
documentation fees, insurance, import/export charges, ^{and the like} ~~etc.~~ are calculated to
provide a total cost to obtain the selected product or products at the selected
destination. In many places import/export fees are based not upon a factory price
of the goods but upon a first preliminary sum, including all necessary expenses to
move the product or goods to the point at which the duties are assessed. These
duties are added to create a second preliminary sum because under some
conditions, additional taxes such as luxury taxes, value added taxes, etc. are based
upon the second preliminary sum which includes transport expenses, some sales
taxes and some import/export duties. So the final sum displayed at step 136
includes all of the taxes under all of the circumstances is based upon applying
coefficients (based upon tax rates) to the previous two sums. The example of
Table A ^{Kind of} ~~Appendix I~~ indicates the values that are involved, and how some of the taxes in
the destination country are calculated based upon previously calculated product
cost, freight costs, insurance, taxes, etc.

The results of this calculation ^(step 134) are converted ~~(at step 136)~~ to the currency requested
by the customer in the same manner as described with respect to steps 112, 116,
117 and 118. Thus, a potential customer has ^{a display (step 136) of} the full cost of a foreign transaction
displayed in front of him before the transaction is actually carried out. This is in

contrast to other electronic or internet transaction systems, which do not address international transactions or any but the simplest tax and shipping charges.

At this point the customer has the option of investigating the prices of other

5 products or of entering the order for the products selected. To order the products

(step 140) the customer activates the appropriate area on the menu screen. This

activation triggers two processes. In the first process an order is sent directly to

the vendor electronically (step 142) requesting shipment to the customer's

destination. While this is the preferred method, the order can be buffered

10 electronically by recording devices, or handled by human operators, or any

combination ^{using} of the three to access the order entry operation ^{using} of the fourth data base

and processing center, preferably maintained by the vendor. The vendor can then

process the order for the selected products deduct from inventory and arrange for

shipping to the requested destination.

15 In order for the vendor to ship the selected products, it will be necessary ~~that~~ to

access a source of funds from the customer. Consequently, it is necessary that the

electronic order also initiate a second process, confirmation of customer credit

(step 150). This can be done by ^{(at step 150) fifth} accessing a ~~sixth~~ data base and processing center,

20 preferably a credit or funds transfer system. Preferably, this operation will be

carried out using a credit card processing center to receive and encode the credit card number using a commercial security system such as PGP (Pretty Good Protection) to confirm the validity of the credit card. The same processing center can then send a confirmation for the respective customer order to the vendor (step 160) by accessing the vendor order entry system (fourth database). Transmission of credit data between customer, vendor and standard credit card system carried out by the instant transaction system.

However, standard credit card authorization is not necessary for the inventive system to function. A conventional authorization can be carried out using two commercial banks, one representing the vendor and the other the customer. This is the manner in which funds are usually transferred between two countries having different currencies. However, such transfers are often awkward and time consuming requiring exchange of papers and the approval of bank officers. Thus, the conventional exchange of funds between foreign banks could greatly hinder the operation of the inventive system even if carried out electronically by the present transaction system. Consequently, the use of international credit cards, such as American Express, is generally favored to expedite the operation of the present invention. However, even international credit cards can sometimes hinder the operation of the present invention due to limitations on the banks issuing the

credit cards.

Consequently, another preferred method of authorizing credit includes the establishment of a system of clearing houses operating parallel to that of commercial banks and credit card organizations. Each vendor participating with the transaction system provider operating the present invention would make arrangements to accept credit verifications from local clearing houses established by the system operator in each country where the vendors are located. The clearing houses in different countries would be in direct electronic communication with each other over the internet, satellite links, intranet, dedicated data lines or any EMF communications links, providing data transfer secured by commercial encrypting packages, such as PGP or SET. The clearing houses in each country could accept local credit cards in the same manner as any local vendor. Thus, a customer's local credit card could provide access to funds to a local clearing house like any vendor obtaining funds via credit card, which could transfer credit for the customer to a clearing house overseas without the necessity of passing through the complicated international banking procedures. A foreign vendor whose products are about to be purchased by the customer could be paid through a electronic clearing house that has received clearance from the clearing house in the customer's country. The clearing house in the vendor's country would act like a

local credit card company, transferring funds to the vendor on behalf of the customer. Preferably, the entire transaction would take place electronically in the same manner that most credit card transactions are handled conventionally. Thus, funds available to a customer from local bank credit in the Netherlands could be translated into funds available to American factory which will send the car to a Virginia port for export ^{as depicted in Table A} ~~(see Appendix I)~~.

Once electronic funds (or other authorization) are transferred to the vendor (step 161) from a local clearing house, the vendor will utilize a connection to the transaction system of the present invention to generate an electronic title (step 165) also referred to as a commercial invoice. Paper copies of the title or commercial invoice can also be generated from the electronic original for archival purposes or for presentation to entities requiring hard copies to further process the title or commercial invoice. Generation of the electronic title (at step 165) is done to create a faster transfer of title through all the official channels that must approve of the title and from there to the customer. The electronic title can be generated by the vendor or the instant transaction system upon authorization by the vendor.

Conventionally the hard copy of the commercial invoice accompanies the goods and must be hand-carried to all of the official entities (such as ^{the} national ~~the~~ customs services) that must process the papers, check the goods and authorize

movement in and out of a particular country. Also, the conventional handling of the commercial invoices results in extra fees to the customer, but cannot be avoided since it must take place at every discrete leg of the shipping route. Further, the loss of these papers can be catastrophic in terms of receiving the goods in a timely fashion.

Upon generating the electronic commercial invoice (step 165 based upon vendor authorization or provided by the vendor), the vendor must carry out two types of activities. The first is administrative, and includes satisfying the requirements of the various governmental and regulatory entities controlling commerce and manufacturer at the location of the vendor (step 180). The second is to arrange transportation to the point requested by the customer (step 170). Under the simplest condition, this means paying the sales tax and a carrier to ship the goods at least part of the way to the customer's requested destination.

However, when international transactions are involved, such as that depicted in Table A, a great deal more administrative work is necessary. Further, there are also added complications and expenses in the actual packing, handling and shipping processes. In such a situation, the vendor must arrange and pay for transport from the factory to a shipping port (step 170), as well as all handling

charges, warf fees, packing fees and the insurance that is always necessary when sending valuable goods by ship. A similar process takes place when goods are sent by air although there are fewer complications in terms of moving the goods from a terminal (usually where the national customs and export authorities must approve the goods) onto a plane. Of course, to move anything onto an international carrier such as a ship or a plane, the commercial invoice, packing list and any governmental release papers are needed, indicating that goods have been cleared for export. In the alternative the present transaction system can make the shipping arrangements on behalf of the vendor.

Along with the physical packing, handling and shipping of the goods, it is necessary to carry out the administrative functions. The present inventive system handles these (step 18⁰) by sending electronic requests to the necessary governmental agencies based upon the commodity code from the harmonized and the country of destination. This combination will trigger a series of operations (out of a large number of possible operations) to satisfy the administrative requirements for carrying out the transaction, including the generation of all necessary documents based on data from the third database.

For example, the combination of destination and commodity code may

automatically trigger a request to the Department of Commerce (DOC) for an export license. This can be done electronically since the DOC, like most government entities, is capable of receiving communications via e-mail and responding thereto. The electronic title can be sent as part of the request for the export license, and the response from the state department returned electronically. The electronic documentation from the DOC can then be used to make a request to the State Department to obtain clearance to export the subject goods, if the commodity code and destination country justify that such a request be made. The electronic indication of an export license from the Department of Commerce and the electronic clearance document from the State Department can be sent electronically to the U.S. Customs service along with the electronic title to obtain prompt clearance that will allow the goods to be transferred quickly from the local carrier to an international carrier such as a plane or ship.

At
As step 170, the vendor has the option of paying the local taxes, local transport costs, insurance, packaging, etc. himself, or contracting to have some of this done though the inventive transaction system. For example, the transaction system provider can arrange to pay local taxes, arrange for local transport and insurance. However, because most vendors currently have systems in place to efficiently handle such tasks, it is unlikely that the duties will fall to the operator of the

transaction system.

On the other hand, the payment of export duties, export license fees and handling through customs are tasks far more suited to the present transactions system since it is normal to have the customer pay for these requirements, and the system operator has direct access to ~~funds~~ provided on behalf of the customer, either through a credit card company or the system operators own electronic clearing houses. The electronic documents can easily be converted into hard copies if signatures are necessary and the signature converted back to electronic documents.

With the increasing acceptance of government entities in general to accept electronic signatures (such as that provided by a facsimile machine), it is feasible that electronic signatures can be attached to the modified electric documents by a number of ways already well-known in the conventional technology. Approvals from various government entities and the customs service can be added to the document electronically either by machine or by scanning in the written signature and stamps of an authorizing official.

When dealing with international carriers such as ships or airplanes, goods to be transported are normally moved with the commercial invoice attached thereto.

The goods are placed into the keeping of an official of the international carrier

(step 176), such as a ship's captain, and the captain also takes possession of the commercial invoice (step 186). Normally, a bill of lading and export packing list are attached to the goods and a copy kept with the commercial invoice. In

conventional transactions, when reaching the destination port, the international

6 5 carrier official (such as the ^{ship's}~~ship's~~ captain) will turn over the commercial invoices to a commercial entity which specializes in moving the papers from the carrier to the customs department of the destination country. This also adds expense to

international transactions. However, with the present transaction system, the

electronic titles and export packing list for the goods can be transferred directly

10 from the international carrier official by system operator to the national customs departments of the destination country at the port receiving the goods at issue

(step 187). Normally this is done by carriers such as FedEx, UPS, etc., and is

often done in conjunction with moving the goods off the warf/ramp/tarmac to the national customs area (step 177). Rather than providing a hard copy of a

15 commercial invoice, an electronic copy with the authorization of the international carrier can be provided either as an electronic document or a hard copy can be

generated and provided with the signature of an official of the international

carrier. Preferably, the electronic documentation will be presented to the customs officials along with payment of the precalculated taxes, import duties, value added

20 taxes, luxury taxes, etc (step 188). Transfer of funds can be made electronically to

the national customs service or other governmental services if this is permitted.

Otherwise, the transaction system of the present invention can arrange for the funds to be provided to the international carrier or some other agent for presentation to the customs officials when the commercial title, bill of lading, etc. are presented so that the goods can clear national customs.

Once the goods have been moved out of the customs area, a local carrier can take possession (step 178) and begin delivery to the requested customer destination (step 179). The present system is capable of arranging payments with local carriers so that the customer does not have to go through this process. It is expected that this arrangement will be more convenient since the translation system operator will probably have better arrangements with local carriers that can be obtained by individual customers. The system operator will also have direct access to customer funds to ensure that payment to the local freight carriers is made.

Once the commercial invoice clears the customs service, the document can be sent electronically via the internet, intranet, facsimile, PTP, or any other convenient means, directly to the customer (step 189). The electronic title, modified in accordance with the customs regulations of the two respective countries and the

international carrier, will provide a complete memorialization of transfer of the goods from the factory to the final destination point. Based upon the dates added to the electronic title, the customer will know exactly where his goods were during the time taken to traverse the route from the factory to the final destination. Thus, the customer will have a complete record for monitoring costs and determining the point at which possible damage occurred.

Once an order is entered (step 140) the customer information is loaded into the customer database and inventory information updated. The customer information can be used to create customer profiles to be stored in the ^{Sixth} ~~7th~~ database ^(not shown) and processing center. Such information can later be used to guide customers to catalogues or products related to previous purchases, as well as previously selected languages and currencies.

The present invention provides a comprehensive point-to-point cost analysis for any international transaction, as well as transactions conducted within a single country. All costs are disclosed to the customer before the order is actually entered. The transaction system also provides automatic fund transfers via credit card systems or virtual currency in clearing houses to carry out the transaction, paying any necessary governmental agencies electronically. By conducting

electronic transactions, the necessity of forwarding paperwork in international transactions is often eliminated, and the overall costs reduced. Further, by providing an electronic title as the commercial invoice, the documentation flow is facilitated, costs reduced and the customer receives proof of purchase in a more timely fashion. As a result, international transactions can be carried out without unexpected charges being assessed against the customer upon delivery of the goods.

Although a number of embodiments of the present invention have been disclosed by way of example, the present invention is not to be limited thereby. Rather, the present invention should be interpreted as including all variations, permutations, adaptations, configurations that would occur to one skilled in this art who has been taught the present invention as construed only by the following claims.
